

DV04

High-precision Gearwheel flow meter for viscous liquids

- For fluids with viscosities of at least 20 cSt
- Very cost effective
- Cast iron or stainless steel designs available
- Accuracy better than 0.3% of measured value
- High resolution
- Pressure-proof construction withstands up to 400 bar
- Small installation dimensions

Description:

The measuring mechanism in the DV04 flow meter consists of a pair of gearwheels that are driven by the fluid stream, much like a gearwheel pump. The measuring mechanism is supported by sleeve bearings or ball bearings. Two anti-magnetic sensors, with a relative phase offset of 90° and hermetically isolated from the measuring chamber, sense the movement of the gear wheels. This two-channel sensing system used with appropriate electronics permits a higher measurement resolution as well as detection of flow direction. All flow meters are optionally available in an explosion-proof design with a separate switching amplifier. The DV04 gearwheel flow meter features very low resistance to flow and particularly low sound pressure levels.

Applications:

Their outstanding measuring accuracy and high resolution make these devices particularly suitable for use in test stands when measuring small and very small flow volumes.

Other areas of application:

- Measuring consumption rates
- Controlling and regulating filling processes
- Dosing of oils and chemicals
- Flow measurement of paints and varnishes
- Controlling the ratio of polyalcohol/polyhydroxy alcohol and isocyanate
